What Is DeltaWiFi Connect?

Delta Wi-Fi Connect refers to the process of joining Delta's onboard Wi-Fi network and accessing available internet services during a flight. Passengers generally connect by enabling Wi-Fi on their device and selecting the appropriate onboard network. After connecting, the onboard portal can guide travelers through the available connectivity options. The experience may differ depending on the aircraft, route, and type of internet service available.

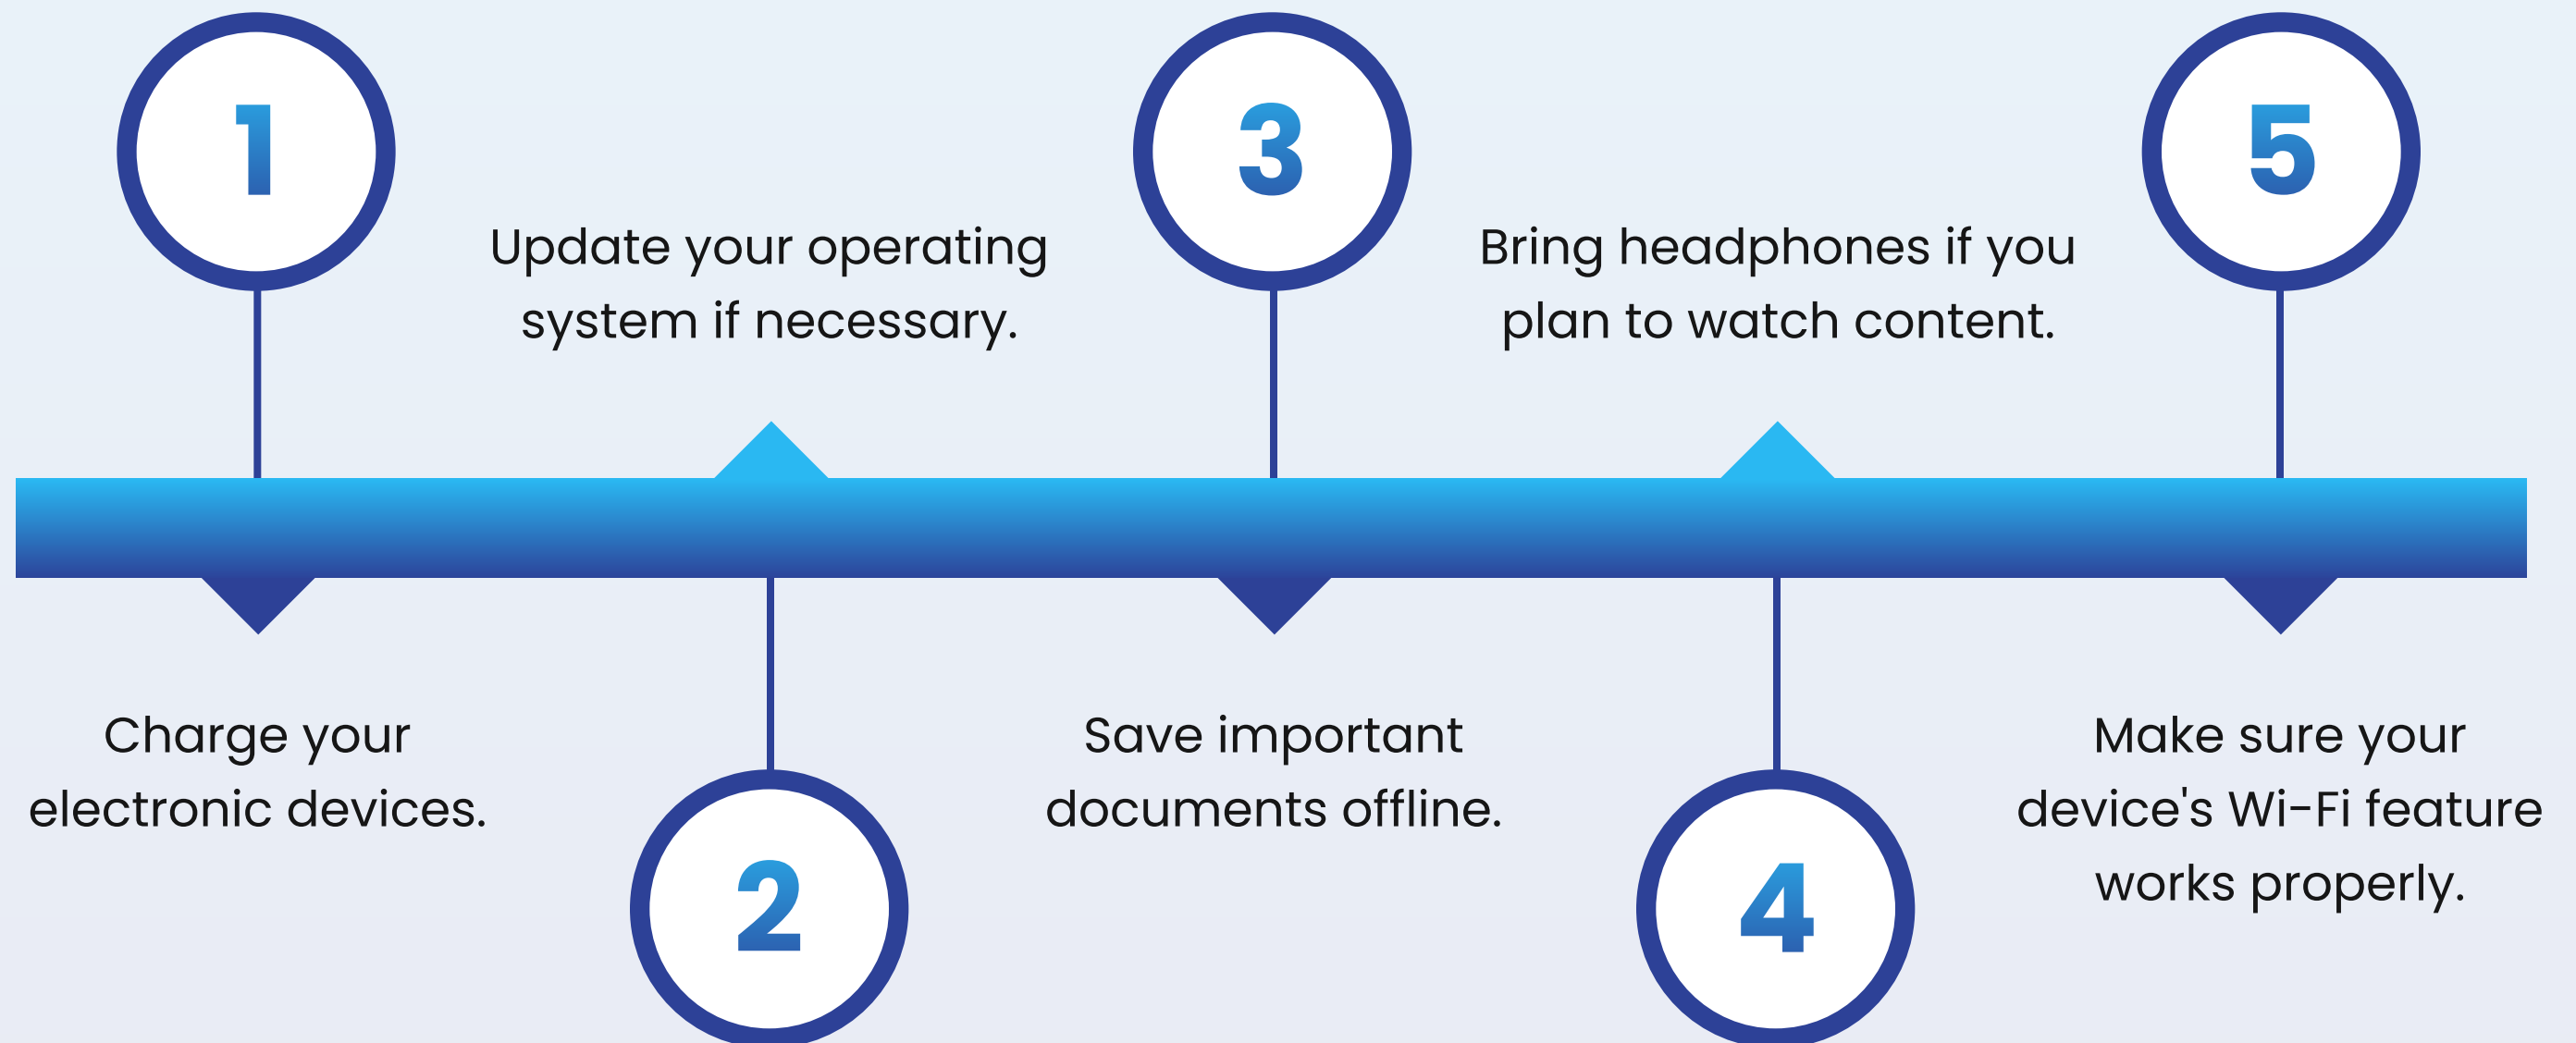

- Communication with family and friends
- Work and business activities
- Email access
- Online browsing
- Travel planning
- Checking important information while traveling

How to Prepare Before Your Flight?

Preparing your device before boarding can make connecting to Deltawifi easier. Make sure your smartphone, tablet, or laptop is charged and that Wi-Fi functionality is enabled.

It is also useful to update your device and close unnecessary applications before boarding. Passengers who plan to work during the flight should save important files locally in case connectivity becomes temporarily unavailable.

Before boarding:

Turn On Airplane Mode

After boarding and once the crew instructs passengers to use airplane mode, enable Airplane Mode on your device.

Airplane Mode disables cellular communication, but you can generally turn Wi-Fi back on separately when permitted.

Basic steps:

- Open your device settings.
- Turn on Airplane Mode.
- Turn Wi-Fi back on.
- Wait until the aircraft reaches the appropriate stage of flight.
- Follow crew instructions regarding electronic-device use.

Always follow the instructions provided by Delta flight attendants during the flight.

Connect to the Onboard Wi-Fi

Once Wi-Fi is available, open the Wi-Fi settings on your smartphone, tablet, or laptop. Look for the Delta onboard Wi-Fi network and select it.

After your device connects to the network, the onboard portal may open automatically. If it does not, opening a web browser can sometimes trigger the connection page.

Delta Wi-Fi Connect Steps:

Enable Wi-Fi.

Select the Delta onboard
Wi-Fi network.

Wait for the connection.

Open your browser if the
portal does not appear.

Follow the instructions displayed
on the onboard portal.

Choose the available
connectivity option.

Accessing the Delta Wi-Fi Portal

The onboard Wi-Fi portal is where passengers can access available internet services and information. Depending on the flight, the portal may provide access to connectivity options, entertainment, travel information, and other Delta services. If the portal does not load immediately, check that your device is connected to the correct Wi-Fi network.

Troubleshooting tips:

- Turn Wi-Fi off and back on.
- Reconnect to the onboard network.
- Open a new browser window.
- Disable VPN temporarily if it interferes with the portal.
- Restart the browser if necessary.

What Can You Do With Delta Wi-Fi?

The available internet experience can depend on the aircraft and network conditions. In general, passengers may use onboard connectivity for activities such as messaging, email, browsing, and other online tasks.

For travelers working remotely, Deltawifi connect can provide a convenient way to remain productive during a flight when service is available.

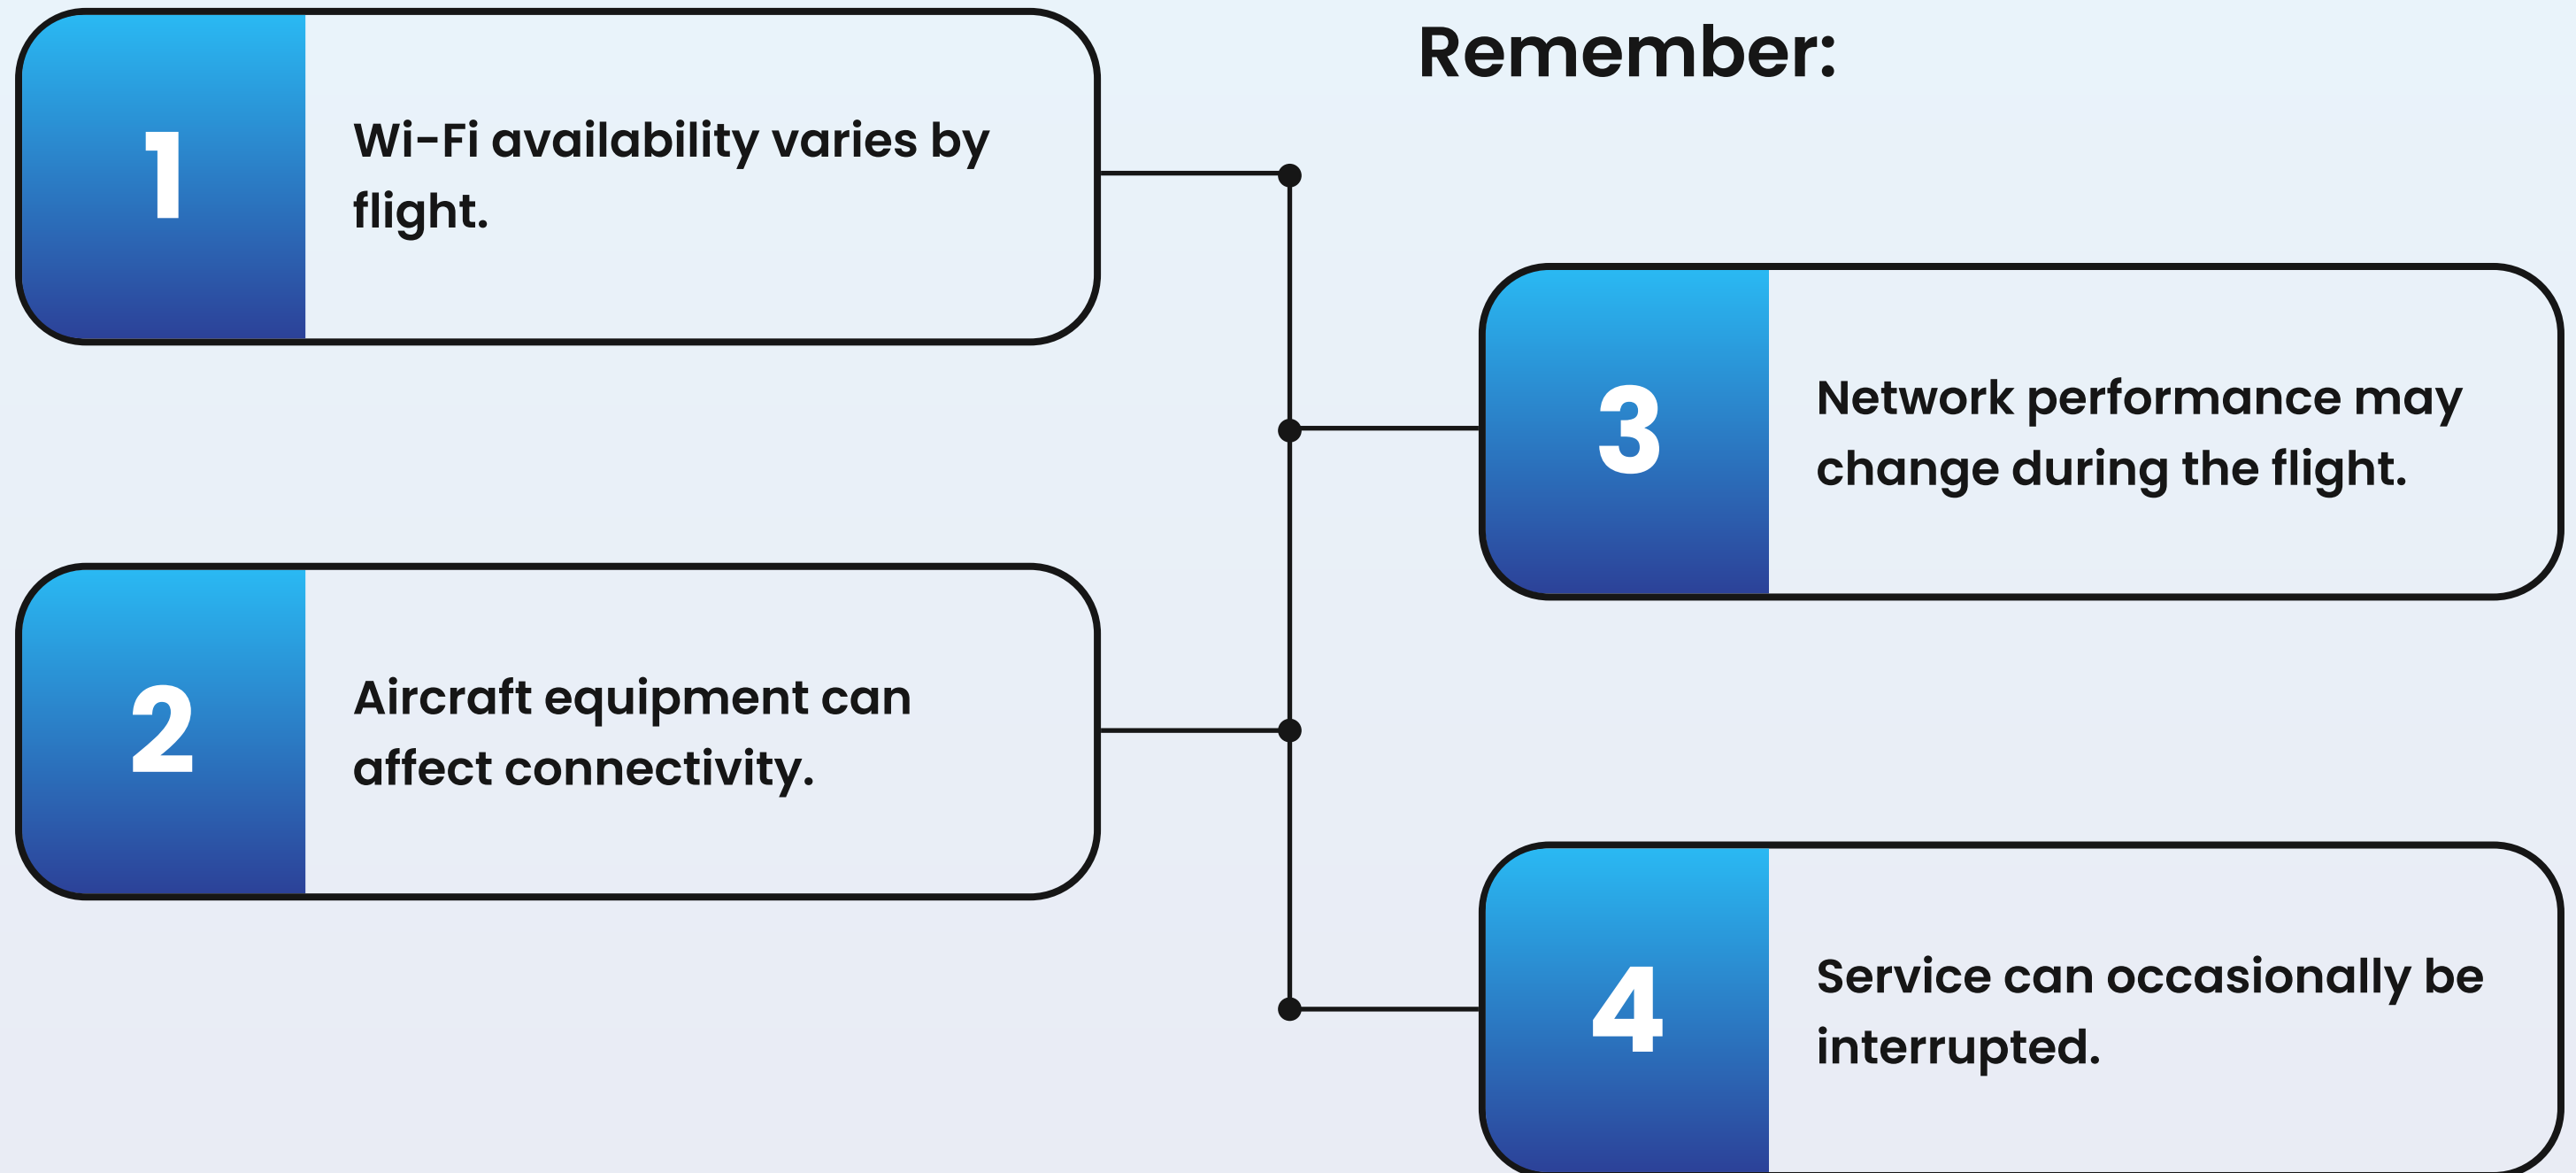

Common activities include:

- Sending and receiving emails
- Checking travel details
- Browsing websites
- Reading online information
- Messaging
- Completing light work tasks

Passengers should remember that in-flight internet performance can vary.

Is Delta Wi-Fi Free?

Delta has offered complimentary Wi-Fi on many flights for eligible passengers, but availability and conditions can vary. Travelers should check the current information for their particular flight because onboard connectivity can depend on aircraft and route. Before relying on Wi-Fi for an important business meeting or other time-sensitive activity, passengers should have an offline backup plan.

Is Delta Wi-Fi Free?

To get the most from Deltawifi, passengers should avoid unnecessary background activities that consume bandwidth. Closing automatic downloads and applications can help keep the device focused on the tasks that matter. If you are working during the flight, download important files before departure.
